Activity 6 Summary for PDF Report

1. jQuery Implementation & Dynamic Tables In this activity, I utilized the jQuery library to move beyond static HTML and create a dynamic user experience. Specifically, in playjq3.html, I wrote a script that defines a User object and stores data in an array. Using a jQuery loop, the script automatically generates table rows and appends them to the DOM. I also implemented logic to apply conditional CSS, creating a "zebra-stripe" effect for better readability. This demonstrates how jQuery can be used to handle data and update the user interface without a manual page refresh.

2. Bootstrap 4.4 Framework & Grid Systems I integrated the Bootstrap 4.4 framework to ensure my personal website is responsive and follows modern design standards. By using the Bootstrap **Grid System** (containers, rows, and columns), I reorganized my Photo Gallery and Hobbies pages to scale appropriately across mobile, tablet, and desktop views. Additionally, I implemented a master **Navbar** featuring a dropdown menu for my Topic 6 activities. This framework allowed me to use pre-styled components like Jumbotrons and Cards, significantly reducing the amount of custom CSS needed while maintaining a professional aesthetic.
